

UT63M147

Features

- 5-volt only operation ($\pm 10\%$)
- Fit and functionally compatible to industry standard transceiver
- Idle low transmitter inputs and receiver outputs
- Dual-channel 50-mil center 24-lead Flatpack
- Dual-channel 100-mil center 36-pin DIP
- Full military operating temperature range, -55°C to $+125^{\circ}\text{C}$, screened to QML Q or QML V requirements
- Radiation hardened to 1 Mrads(Si)
- Supports MIL-STD-1553 (UT63M147)
- Standard Microcircuit Drawing (SMD) 5962-93226 available
 - QML Q and QML V compliant part

Introduction

The monolithic UT63M147 Transceivers are complete transmitter and receiver pairs for MIL-STD-1553A and 1553B applications. Encoder and decoder interfaces are idle low.

The receiver section of the UT63M147 series accepts biphas- modulated Manchester II bipolar data from a MIL-STD-1553 data bus and produces TTL-level signal data at its RXOUT and $\overline{\text{RXOUT}}$ outputs. An external RXEN input enables or disables the receiver outputs.

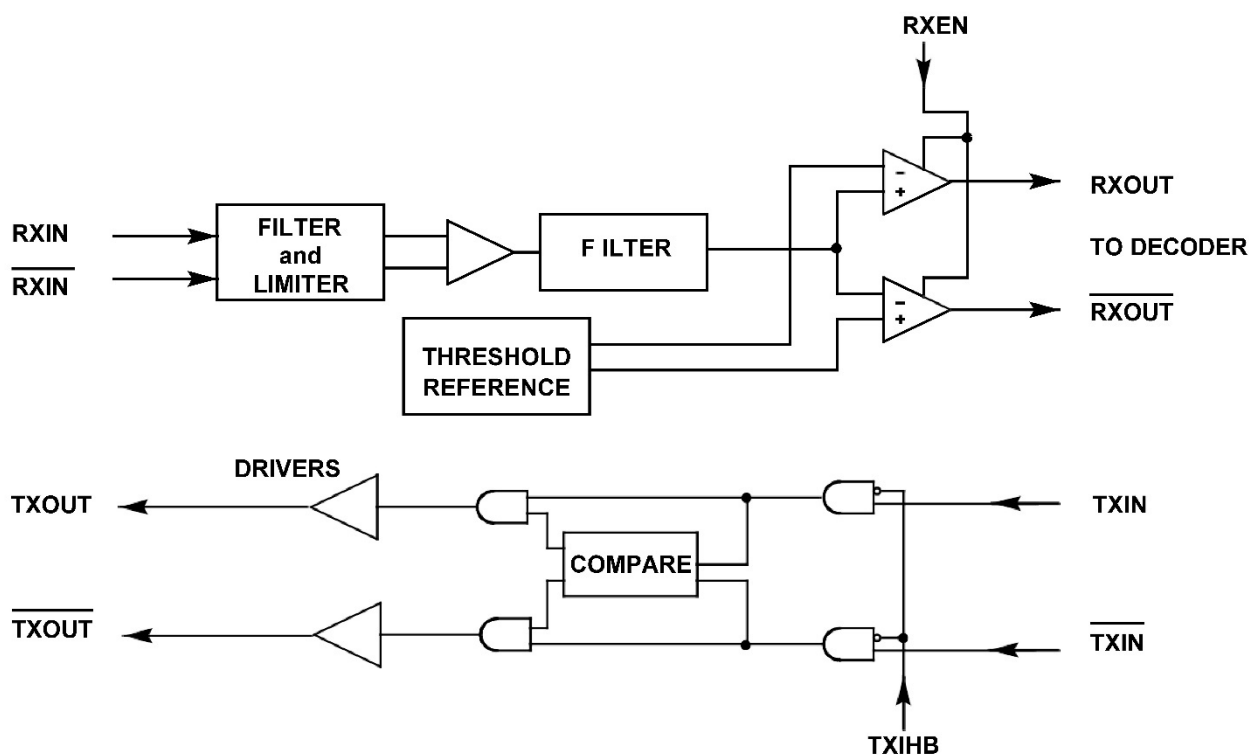

Figure 1. Functional Block Diagram

The transmitter section accepts biphas TTL-level signal data at its TXIN and $\overline{\text{TXIN}}$ and produces MIL-STD-1553 data signals. The transmitter's output voltage is typically $12 V_{PP,L-L}$. Activating the TXIHB input or setting both data inputs to the same logic level disables the transmitter outputs.

UT63M147

The UT63M147 series offers complete transmitter and receiver pairs packaged in a dual-channel 36-pin DIP or 24-lead flatpack configurations designed for use in any MIL-STD-1553 application.

UT63M147

Transmitter

The transmitter section accepts Manchester II biphase TTL data and converts this data into differential phase-modulated current drive. Transmitter current drivers are coupled to a MIL-STD-1553 data bus via a transformer driven from the TXOUT and $\overline{\text{TXOUT}}$ terminals. Transmitter output terminals' non-transmitting state is enabled by asserting TXIHB (logic "1"), or by placing both TXIN and $\overline{\text{TXIN}}$ at the same logic level. Table 1, Transmit Operating Mode, lists the functions for the output data in reference to the state of TXIHB. Figure 3 shows typical transmitter waveforms.

Receiver

The receiver section accepts biphase differential data from a MILSTD-1553 data bus at its RXIN and $\overline{\text{RXIN}}$ inputs. The receiver converts input data to biphase Manchester II TTL format and is available for decoding at the RXOUT and $\overline{\text{RXOUT}}$ terminals. The outputs RXOUT and $\overline{\text{RXOUT}}$ represent positive and negative excursions (respectively) of the inputs RXIN and $\overline{\text{RXIN}}$. Figure 4 shows typical receiver output waveforms.

Table 1. Transmit Operating Mode

TXIN	$\overline{\text{TXIN}}$	TXIHB	TXOUT
x ¹	x	1	Off
0	0	x	Off
0	1	0	On
1	0	0	On
1	1	x	Off ³

Notes:

- 1) x = Don't care.
- 2) Transmitter output terminals are in the non-transmitting mode during Off-time.
- 3) Transmitter output terminals are in the non-transmitting mode during Off-time, independent of TXIHB status.

Data Bus Interface ¹

The designer can connect the UT63M147 to the data bus via a short-stub (direct-coupling) connection or a long-stub (transformer-coupling) connection. Use a short-stub connection when the distance from the isolation transformer to the data bus does not exceed a one-foot maximum. Use a long-stub connection when the distance from the isolation transformer exceeds the one foot maximum and is less than twenty feet. Figure 5 shows various examples of bus coupling configurations. The UT63M147 series transceivers are designed to function with MIL-STD-1553A and 1553B compatible transformers.

Note:

- 1) The 24-lead flatpack internally connects TXOUT to RXIN and $\overline{\text{TXOUT}}$ to $\overline{\text{RXIN}}$ for each channel.

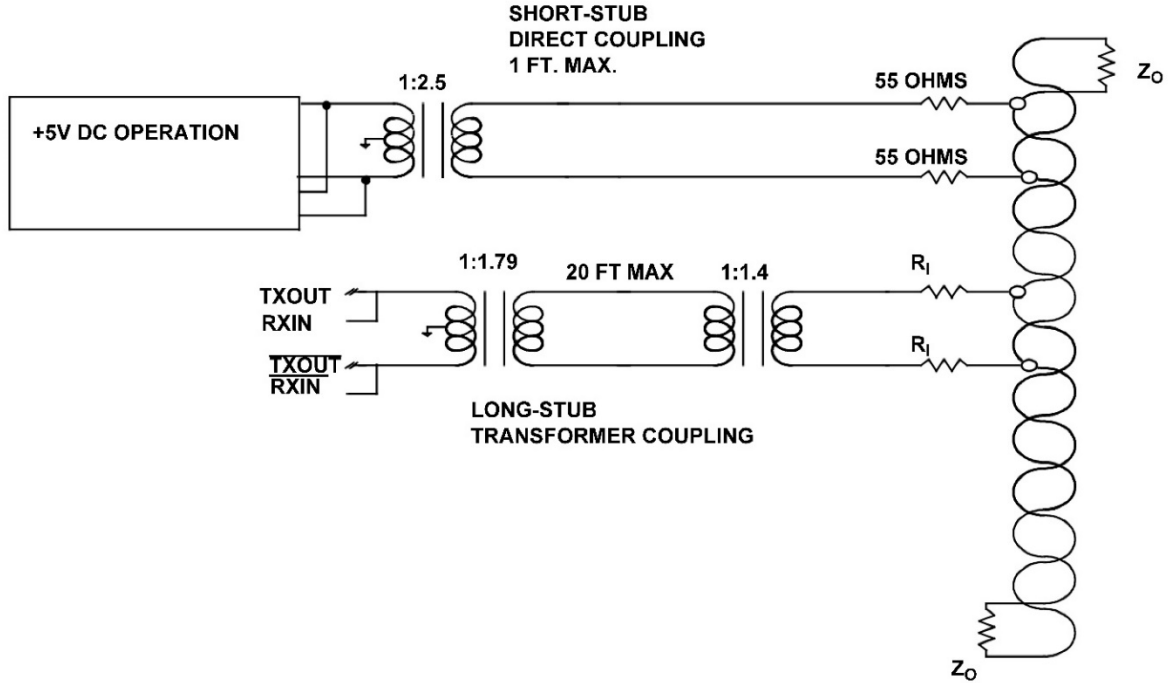

Figure 5. Bus Coupling Configuration

Note:

The isolation resistor (R_i) is defined by MIL-STD-1553B, section 4.5.1.5.1.2 as equal to $0.75 \times Z_o \pm 2\%$. Typically, $0.75 \times 78\Omega = 58.5\Omega$. Z_o is the selected nominal cable impedance.

Recommended Thermal Protection

All packages should mount to or contact a heat removal rail located in the printed circuit board. To insure proper heat transfer between the package and the heat removal rail, use a thermally-conductive material between the package and the heat removal rail. A MIL-STD-883 TM5011 certified thermal bonding material, like AI Technologies ME7159, is a common thermal interface material for space applications.

Receiver common mode input voltage range	-5.0 to +5.0	V

Notes:

- 1) Stress outside the listed absolute maximum rating may cause permanent damage to the devices. This is a stress rating only, and functional operation of the device at these or any other conditions beyond limits indicated in the operational sections of this specification is not recommended. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
- 2) Voltage measurement identified as V_{pp11} are differential measurements. Voltage measurements identified as V_{PP} are single ended measurements with a ground reference.
- 3) Mounting per MIL-STD-883, Method 1012.
